Retrospective:

What went well:
- The lectures and the test suits that had already been created really helped.
- The proof of concepts for cucumber and selenium ran seamlessly.
- Mac integration was not bad, as my Windows machine was not working reliably.

What needs to be improved upon:
- Better use of Jira
  - Not use it as an assignment but to help manage my project better.
- Better segmentation of code
  - Better Refactorization
  - Not over Complicate file and folder structure
  - I tried to match similar statements in cucumber to be one and wasted a lot of time doing that.
  - I tried many sad path scenarios
- If all things were done better, I could have accomplished more

What still needs to be accomplished included
- Refine the tests, as a lot of the failure is due to timing issues.
- Creating better understandable reports.
- I did not test with multi-user having multiple celestial bodies.
